### 2.1 (Vigo2013)

What could be the harm in relying on automated testing? This research look at anumber of available automated evaluation tools and compares their output to that of a team of experts in regards of the coverage, completness and correctness. Results show that relying on tools alone is not reccommnded, because even if the right tool is used only 6 out of 10 violations would be caught. Tools seem to be more effective on very inaccessible sites.

**\*\*TODO:** take a look at some concreet numbers
